Methods of Stamp Printing Letterpress

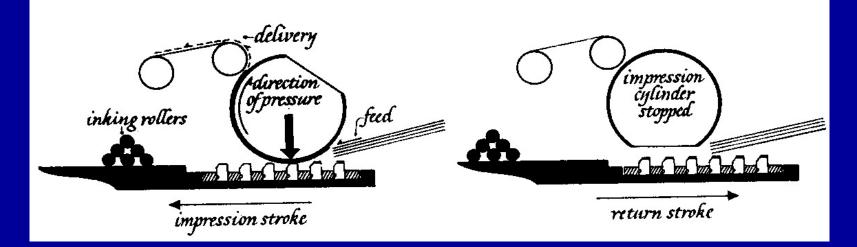

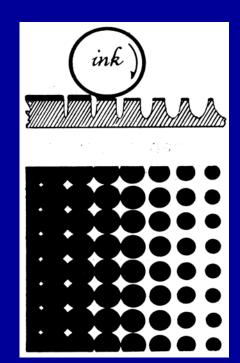

Dr Geoffrey Eibl-Kaye FRPSL

Letterpress Printing

- The printing process used for text
- Can print large areas of solid colour
- Better simulation of tone than intaglio
- Higher speed and cheaper than intaglio
- Dies produced by engraving
- Not of the same fine quality as intaglio

Wharfedale stop-cylinder press

Tone representation in letterpress

Letterpress Examples

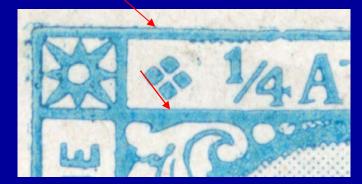

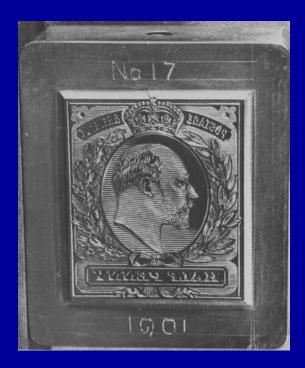

In letterpress printing the ink tends to be squeezed to the sides of a printed area giving a darker edge

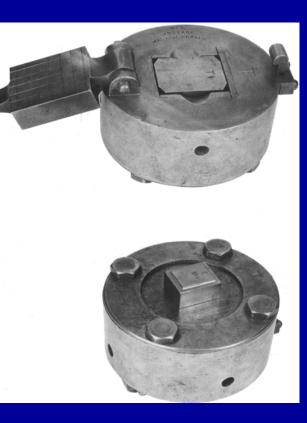

Letterpress Dies

The engraved die

The die is placed in the base of the collar. A blank lead and the plunger are placed in the top

The collar is placed in the hydraulic press which forces the plunger down impressing the die pattern into the lead

Making the Letterpress Printing Forme

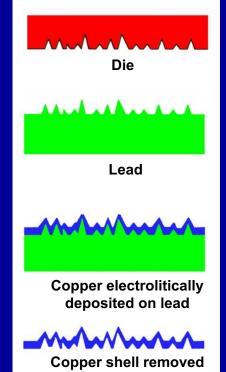

- The leads are assembled into a printing chase with the require no of stamps
- The leads are coated with graphite to improve electrical conductivity
- The whole is placed in an electro-plating bath and a copper or nickel shell deposited
- The shell is removed and backed with type metal
- The whole is then suitably mounted on a base to bring it to type height (diameter of 1s).

Leads and electros made for Alexander Sefi's Advanced Philately

Making the Electro

Two Pence printed by Charles Whiting. The thin layer of electrolytically deposited copper has been backed with type metal to a thickness of about 5 mm and the whole mounted on a wooden base to bring it to type height (diameter of 1s).

Making the Working Plate

- A wax mould made from the copper master plate
- The printing surface is coated with graphite
- This is electroplated with copper or nickel.
- The nickel is then plated with copper
- The shell is backed with type metal and slabbed

Slabbing – To get the printing face flat

Wax Mould after Plating

Nickel Shell

Nickel shell, before backing, made by electroplating the wax mould
